

Practical information

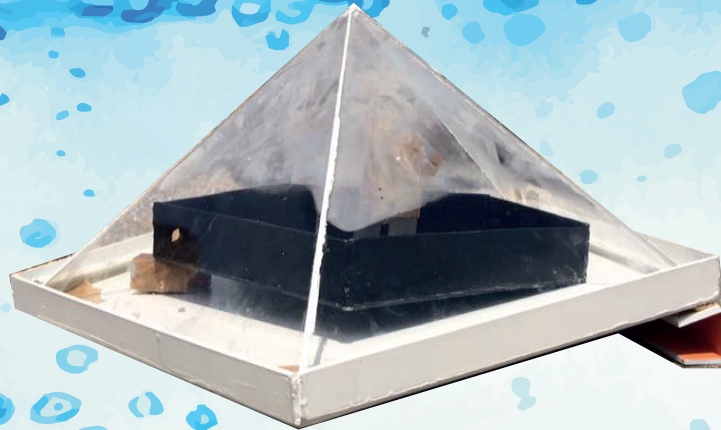

- 💧 Potential user :
Governmental institutions,
ECO-lovers, Refugees, Boat
owner, surfers, ...
- 💧 Efficiency : 35% in 2h
- 💧 Inside Temperature : up to 80°C

The **WATER PYRAMID** will transform salty water into drinkable water following these steps :

- 1) The salty water goes in on the dark container in the middle of the pyramid
- 2) The sun will beat down on the walls and heat the inside of the pyramid
- 3) The heat will release the evaporation of the water
- 4) Thanks to the difference of temperature between the inside and the outside of the pyramid, the water vapor will condensate on the walls
- 5) The drinkable water will be collected in the bottom and the salt will remain in the container

A complete automated system due to a pzmp, a valve and ultrasonic sensors
